The presents equence represents mouse PTP05. The above proteins, other than ALK-7, are protein tyrosine phosphatases (PTP9) and are used to identify substances that modulate their activity (i.e. agonists and antagonists, including NBP) in vivo or in vitro. These substances are used to treat or prevent diseases associated with abormal signal transduction pathways that involve the proteins, particularly cancer (e.g. lenkaemia and lymphoma), while modulators of ALK-7 (which is a type I receptor particularly for treating Alzhaimer's (Parkinson's or Huntington's diseases. Nucleic acid fragments of the polynucleotides encoding the proteins can be used as probes to identify and clone related sequences; to detect protein-encoded RNA; to generate transgenic animals and in gene thereby (optionally after mutation). Ab are used to determine the

The present invention describes isolated, enriched or purified nucleic acids encoding PTP04, SAD, PTP05, PTP10, ALP and ALK-7 proteins. The presents sequence represents mouse PTP05. The above proteins, other than ALK-7, are protein tyrosine mouse PTP05. The above proteins, other than ALK-7, are protein tyrosine phosphatases (PTPs) and are used to identify substances that modulate their activity (i.e. agonists and antagonists, including NBP) in vivo or in vitro. These substances are used to treat or prevent diseases associated with abnormal signal transduction pathways that involve the proteins, particularly cancer (e.g. leukaemia and lymphorma), while modulators of ALK-7 (Which is a type I receptor serine/threonine kinase) are used to promote neuronal survival, particularly for treating Alzhaimer's, Parkinson's or Huntington's diseases. Nucleic acid fragments of the polymuclectides encoding the croteins can be used as probes to identify and clone related sequences; to detect protein-encoded RNA, to generate transgent animals and in gene therapy (optionally after mutation). Ab are used to determine the
                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                180

The present invention describes isolated, enriched or purified nucleic acids encoding PTP04, SAD, PTP05, PTP10, ALP and ALK-7 proteins. The present sequence represents mouse PTP05. The above proteins, other than ALK-7, are protein tyrosine phosphatases (PTPS) and are used to identify substances that modulate their activity (i.e. agonists and antagonists, including NBP) in vivo or in vitro. These substances are used to treat or prevent diseases associated with abnormal signal transduction pathways that involve the proteins, particularly cancer (e.g. leukaemia and lymphona), while modulators of ALK-7 (which is a type I receptor serine/threonine kinase) are used to promote neuronal survival, particularly for treating Alzhaimer's, Parkinson's or Huntington's diseases. Nucleic acid fragments of the polymucleotides encoding the proteins can be used as probes to identify and clone related sequences; to detect protein-encoded RNA; to generate transgenic animals and in generated by optionally after mutation). Ab are used to determine the

New nucleic acid encoding specific protein tyrosine phosphatases - to identifying specific modulators for treatment and prevention of cancer and neurodegenerative disease.

The present invention describes isolated, enriched or purified nucleic acids encoding PTP04, SAD, PTP05, PTP10, ALP and ALK-7 proteins. The above proteins, other than ALK-7, are protein tyrobina phosphatases the above proteins. The above proteins, other than ALK-7, are protein tyrobinate phosphatases as read are used to identify substances that modulate their activity (i.e. agonists and antagonists, including NBP) in vivo or in vitro. These substances are used to treat or prevent diseases associated with abnormal signal transduction pathways that involve the proteins, particularly cancer (e.g. leukaemia and lymphomal, while modulators of ALK-7 (which is a type I receptor serine/threonine kinase) are used to promote neuronal survival, particularly for treating Alzheimer's parkinson's or in funtington's diseases. Nucleic acid fragments of the polymucleotides encoding the proteins can be used as probes to identify and clone related sequences; to detect protein—encoded RNA; to generate transgenic animals and in gene therapy (optionally after mutation). Ab are used to determine the proteins.

The present invention describes isolated, enriched or purified nucleic acids encoding PTP04, SAD, PTP05, PTP10, ALP and ALK-7 proteins. The above proteins, other than ALK-7, are protein tyrosine phosphatases above proteins, other than ALK-7, are protein tyrosine phosphatases as consists and antagonists, including NBP) in vivo or in vitro. These substances are used to treat or prevent diseases associated with abnormal signal transduction pathways that involve the proteins, particularly cancer (e.g. leukaemia and lymphoma), while modulators of ALK-7 (which is a type I receptor serine/threcoine kinase) are used to promote neuronal survival, particularly for treating Alzaeiments of the polymucleotides encoding the proteins can be used as probes to identify and clone related sequences; to detect protein—encoded RNA; to generate transgenic animals and in gene therapy (optionally after mutation). Ab are used to determine the proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New nucleic acid encoding specific protein tyrosine phosphatases - useful for identifying specific modulators for treatment and prevention of cancer and neurodegenerative disease.
                                                                                                          PTP04; PTP05; PTP10; SAD; ALP; ALK-7; protein tyrosine phosphatase; type I receptor serine/threonine kinase; cancer; leukaemia; lymphoma; neurodegenerative disease; neuronal survival; Alzheimer's disease; Parkinson's disease;

The present invention describes isolated, enriched or purified nucleic acide encoding PTP04, RAD, PTP05, PTP10, ALP and ALK-7 proteins. The above proteins, other than ALK-7, are protein tyrosine phosphatases above proteins, other than ALK-7, are protein tyrosine phosphatases (PTP9) and are used to identify substances that modulate their activity (i.e. agonists and antagonists, including NBP) in vivo or in vitro. These substances are used to treat or prevent diseases associated with abnormal signal transduction pathways that involve the proteins, particularly cancer (e.g. leukaemia and lymphoma), while modulators of ALK-7 (which is a type I receptor serine/threonine kinase) are used to promote neuronal survival, particularly for treating Alzheimer's, Parkinson's or Huntington's diseases. Nucleic acid fragments of the polymucleotides encoding the proteins can be used as probes to identify and clone related sequences; to detect protein-encoded RNA, to generate transgenic animals and in gene therapy (optionally after mutation). Ab are used to determine the proteins. The present sequence represents a human PTP05 peptide from the present invention
                                                                                                                                          PTP04; PTP05; PTP10; SAD; ALF, ALK-7; protein tyrosine phosphatase; type I receptor serine/threonine kinase; cancer; leukaemia; lymphoma; neurodegenerative disease; neuronal survival; Alzheimer's disease; Parkinson's disease; Huntington's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                nucleic acid encoding specific protein tyrosine phosphatases identifying specific modulators for treatment and prevention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    7.2%; Score 29; DB 2; Length 29;

The present invention describes isolated, enriched or purified nucleic acids encoding PTP04, SAD, PTP05, PTP10. ALP and ALK-7 protechs. The present sequence represents rat PTP10. The above proteins, other than ALK-7, are protein tyrosina phosphatases (PTP8) and are used to identify substances that modulate their activity (i.e. agonists and antagonists, including NBP) in vivo or in vitro. These substances are used to creat or prevent diseases associated with abnormal signal transduction pathways that involve the proteins, particularly cancer (e.g. leukaemia and lymphoma), while modulators of ALK-7 (which is a type I receptor serinchthreonine kinase) are used to promote neuronal survival, particularly for treating Alzheimer's, Parkinson's or Huntington's diseases. Nucleic acid fragments of the polynucleotides encoding the proteins can be used as probes to identify and clone related sequences; to detect protein-encoded RNA; to generate transgenic animals and in gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New nucleic acid encoding specific protein tyrosine phosphatases - useful for identifying specific modulators for treatment and prevention of cancer and neurodegenerative disease.
                                                                                                            PTP04; PTP05; PTP10; SAD; ALP; ALK-7; protein tyrosine phosphatase; type I receptor serine/threonine kinase; cancer; leukaemia; lymphoma; neurodegenerative disease; neuronal aurvival; Alzheimer's disease; Parkinson's disease; Huntington's disease.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to an isolated polypeptide, which is a human kinase and phosphatase (RPP). KPP agonists and antagonists are useful for diagnosing, treating or preventing disorders associated with aberrant expression of KPP, particularly cell proliferative disorders (e.g. arteriosclerosis atherosclerosis, cirthosis, hepatitis, paroxysmal noturnal hemoglobinuria, polycythaemia vera, psoriasis, primary thrombocytopaemia or cancer), developmental disorders (e.g. nocturnal hemoglobinuria, polycythaemia vera, psoriasis, primary thrombocytopaemia or mental retardation), neurological disorders (e.g. Alzheimer's disease, parkinson's disease or epplepsy), autoimmune, inflammatory disorders (e.g. Alzheimer's disease, parkinson's disease or explication of properties, asthma, autoimmune thyroiditis, contact dermatitis, Crohn's allergies, asthma, autoimmune thyroiditis, contact dermatitis, Crohn's allergies, asthma, autoimmune thyroiditis, contact dermatitis, Crohn's disease, Hashimoto's thyroiditis, irritable bowel syndrome, multiple sclerosis, osteoarthritis, sigoren s syndrome, vertis), or viral, bacterial, fungal, parasitic, protozoan or helminthic infections. The KPP is useful in assessing the effects of exogenous compounds on the captened and kinases and phosphatases. KPP gene is useful in gene therapy and for creating transgenic animals to model human disease. The present sequence is human KPP protein
                                                                                                                                                                                Human; kinase; phosphatase; KPP; cell proliferative disorder; hepatitis; atherosclerosis; cirrhosis; haemoglobimuria; polycythaemia vers; cancer; psoriasis; thromobocytopaenia; developmental disorder; Reiter's syndrome; renal tubular acidosis; anaemia; mental retardation; Alzheimer's disease; netucimenne disorder; Parkinson's disease; epilepsy; glomerulonephritis; autoimmune disorder; inflammatory disorder; ADS; Goodpasture's syndrome; acquired immune deficiency syndrome; immunosuppressive; Grohn's disease; noctropic; transgenic; dermatitis; multiple sclerosis; diabetes mellitus; allergy; apout; Grave's disease; Hashimoto's thyroiditis; bowel syndrome; osteoporosis; rheumatoid arthritis; Sjogren's syndrome; ophthalmological; gene therapy; asthma; anticonvulsant; uropathic; pancreatitis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gorvad AE;

The present invention relates to a new human tyrosine phosphatase

polypeptide. The invention is useful for the preparation of a medicament

for for modulating the activity of human tyrosine phosphatase in a disease

such as obesity, diabetes, a central nervous system (CNS) disorder,

chronic obstructive pulmonary disease, cardiovascular disorder or cancer.

The invention is useful for treating a human tyrosine phosphatase

dysfunction related disease, preferably the above mentioned diseases. The

invention is useful for treating the above mentioned diseases. The

invention is useful for treating the above mentioned diseases. The

chroked disease, and Huntington's disease, and the

cardiovascular discreter from Parkinson's disease, and the

cardiovascular discretering selected from congestive heart failure and

myocardial infarction. The molecules of the invention are useful in

susceptibility to disease and abnormalities related to the presence of

mutations in the polyducleotide coding the polypeptide of the invention.

The present amino acid sequence represents the human tyrosine phosphatase

protein #1 of the invention. This sequence is encoded by the human

tyrosine phosphatase gene located on chromosome 10
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

The present invention describes an isolated cancer associated phosphatase nucleic acid. Also described: (1) a method of screening for biologically active agents that modulate a cancer associated phosphatase function; (2) a method for the diagnosis of cancer; (3) a method for inhibiting the cancer cell; (4) methods of screening for targets of a cancer call; (4) methods of screening for targets of a cancer call; (5) a compound (C) for the treatment of a tumour; (6) a composition for the treatment of a tumour comprising a pharmaceutical carrier and (C); (7) methods for treating a tumour; (8) a method for vigualising a tumour in a patient. A cancer associated (8) a method for vigualising a tumour in a patient. A cancer associated phosphatase of the present invention has cytostatic, immunosuppressive, antidiateriosclerotic, antidiated; on the cancer associated of phosphatases and nucleic acids encoding the proteins are useful for cystalising tumours in patients or diagnosing and treating cancer, e.g. phosphatases and nucleic acids encoding the proteins are useful for cystalising tumours in patients or diagnosing and treating cancer, e.g. pancreas, lung, ovarian, liver or colon cancer. The polypeptides and nucleic acids may also be used for treating hyperproliferative diseases, cyclematoid arthritis, psoriasis, attermining patient prognosis, and inflammation, scarring, cheumatoid arthritis, psoriasis, attermining the effectiveness of drugs, cheumatoid arthritis, psoriasis, attermining the effectiveness of drugs, determining patient prognosis, and arthritish prognosis, as attegets for screening pharmaceutical agents that inhibit the growth or metastasis of tumour cells. The present sequence represents the human cancer associated phosphatase
New mucleic acids encoding cancer associated phosphatases, useful as targets for screening pharmaceutical agents that inhibit the growth of tumor cells, or for diagnosing and treating cancer, inflammation or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New polynucleotides, useful for expressing recombinant proteins for analysis, characterization or therapeutic use, or as markers for tissues in which the corresponding protein is preferentially expressed.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention comprises the amino acid and coding sequences of novel proteins. The DNA and protein sequences of the invention are useful as: markers for tisanes in which the corresponding protein is preferentially expressed; as molecular weight markers on gels; as chromosome markers or tags; to identify chromosomes or to map related gene positions; and to compare with endogenous DNA sequences in patients to identify potential genetic disorders. The present amino acid sequence was used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Wang J;

The invention relates to an isolated polypeptide, which is a human kinase and phosphatase (KPP). KPP agonists and antagonists are useful for diagnosing, tracting or preventing disorders associated with aberrant expression of KPP, particularly cell proliferative disorders (e.g. arteriosclerosis, atherosclerosis, cirrhosis, hepatitis, paroxysmal nocturnal haemoglobiuntia, polycythaemia vera, psoriatis, paroxysmal thromobocytopaenia or cancer), developmental disorders (e.g. renal tubular acidosis, anaemia or mental retardation), neurological disorders (e.g. Alzheimer's disease, Parkinson's disease or epilepsy), autoimmune, allergies, asthma, autoimmune thyroiditis, contact dermatitis, Crohn's allergies, asthma, autoimmune thyroiditis, contact dermatitis, Crohn's aliease, diabetes mellitus, glomerulonephritis, Goodpasture's syndrome, multiple sclerosis, osteoarthritis, glomerulones, pancreatitis, Reiter's syndrome, theumaroid arthritis, Sjogren's syndrome, uvetis), or viral, succerial, fungal, parsitic, protozoan or helminthic infections. The KPP is useful in assessing the effects of exogenous compounds on the expression of nucleic acids and kinases and phosphatases. KPP gene is

The present sequence is numera process in the diagnosis, treatment and present sequence is numera process, neurological disorders, treatment and prevention of inturne system disorders, neurological disorders.

C developmental disorders and cell proliferative disorders. Examples of developmental disorders include acquired immune deficiency syndrome (AIDS), severe combined immunodeficiency disease (SCID), adult respiratory distress syndrome, allergies, amylcidosis, anaemia, asthma, crepitatory distress syndrome, allergies, amylcidosis, anaemia, asthma, crepitatory distress syndrome, gout, Graves disease, multiple crepitatorsis, wysathenia gravis, myocardial or pericardial inflammation, osteoarthritis, Sigren's syndrome, solecoderma, systemic scleoarthritis, osteoporosis, pancreatitis, psoriasis, Reiter's syndrome, certardation and other developments include Alzheimer's disease, dementia, epilepsy, Parkinson's disease, mental retradation and other developmental disorders include Alzheimer's disease, mental disorders including ademocarcinoma, law schebal palsy, periodic paralysis, mental disorders include e.g. renal tubular acidosis, Duchenne and affective disorders unxiety, and schizophrenic disorders, seasonal affective disorders include e.g. renal tubular acidosis, Duchenne and proliferative disorders include e.g. renal tubular acidosis, Duchenne and affective disorders include e.g. canal tubular acidosis, Duchenne and confluding ademocarcinoma, laukaemia. The polypeptide and polyprocleoe confluding ademocarcinoma, laukaemia. The polypreptide and polyprocleoe confluding ademocarcinoma, laukaemia. The polypreptide and polyprocleoe conflue or reating Archeriosal conflue or resting Archeriosal confluence or a cell type, for or its modulator. The polyprocleome of a tissue or cell type, or numanised animals (pigs) or transgenic animals or acting a tissue or cell type, or numanised animals (pigs) or transgenic animals or acting a tissue or cell type.

C type, which represents the global pattern of gene expression by a

The invention comprises the amino acid and coding sequences of novel proteins. The MNA and protein sequences of the invention are useful as: markers for tissues in which the corresponding protein is preferentially expressed, as molecular weight markers on gels, as chromosome markers or tegs; to identify chromosomes or to map related gene positions, and to compare with endogenous DNA sequences in patients to identify potential genetic disorders. The present amino acid sequence represents a protein
                                                                                                                     New polynucleotides, useful for expressing recombinant proteins for analysis, characterization or therapeutic use, or as markers for tissues in which the corresponding protein is preferentially expressed.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to isolated polynucleotide (I) and polypeptide (II)

                                                                                                                                                                                                                                                                                                                                               RESULT 17
AAY34161
 ò
          caction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymoclectides are also used in diagnostics as expressed sequence tags for identifying expressed cactivity of (II) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful in generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (II) and (II) are useful in medical imaging of sites expressing (II). (II) and (II) are useful for treating disorders plypeptide and polymoclectide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic maino acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at the printed specification, but was obtained in the wing obtained in the printed specification, but was obtained in the printed specification.
                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Protein tyrosine phosphatase D1 - useful in screening assays for e.g.
                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; protein tyrosine phosphatase; skeletal muscle; hybridisation;
  is useful as hybridisation probes, polymerase chain

                                                                                                                                                                                                                                                                                                                                                                                                                             AAW67441
```

```
This sequence represent the N-terminal amino acid sequence of the human protein tyrosine phosphatase D1 (PTP-D1). The coding fragment was amplified by PCR. The complete gene sequence (AAV34368) was isolated from a human skeletal muscle CDNA library. The phosphatase is used e.g. in a hybridisation assay for detecting a nucleic acid encoding a normal or mutant PTP-D protein or alycoprotein in a cell or subject, using a nucleic acid comprising at least part of a normal or mutel comprising at least part of a normal or mutel properties or a screening assay for a compound capable of binding to a PTP-D protein or glycoprotein or the compound-binding portion of it attached to a solid support. (Updated on 25-MAR-2003 to correct PR field.)

This sequence represents a partial fragment of the protein tyrosine a subfamily of brotherin, designated PTP-DI. The new PTP proteins are a subfamily of protein tyrosine phosphatases (PTP-DI. The new PTP proteins are growth factor signal transduction, cell cycle progression, and neoplastic formation. The DNA sequence may be used in the recombinant production of PTP-DI according to standard DNA methodology. The protein expressed may then be used in assays to identify modulators of its enzymatic activity and in the production of antibodies. The nucleic acids may also be used in assays to detect and quantify expression of PTP-DI in samples. Methods in assays to detect and quantify expression of PTP-DI in samples. Methods activity of the protein can serve as methods for identifying amount or susceptibility to cancer, diabetes, or other disorders associated with alterations in cellular phosphotyrosine metabolism

Isolated human polynucleotides encoding polypeptides, useful for the treatment and diagnosis of e.g. cancer, ulcers and HIV infection.

```
AMM99166 to AAM99904 encode the human proteins given in AAM25255 to
AAM2593. The proteins can have activities based on the tissues and cells
they are expressed in, such as: antiinflammatory; antirheumatic;
antiarthritic; immunosuppressive, antibacterial; endocrine; cardiant;
cartiardovascular; antianaemic; antiagatesial; endocrine; cardiant;
cartiovascular; antianaemic; antiagatesial; undiretary;
antiulcer; osteopathic; dermatological; antiallergic; antiamtatic;
antidabetic; cytostatic; neuroprotective; antidepressant; nootropic;
antiparkinsonian; and immunostimulant. The proteins and polymucleotides
encoding them can be used in gene therapy, antisense therapy and vaccine
production, The proteins and polymucleotides are useful for screening for
agonists or antagonists of a protein and for the treatment and diagnosis
of disorders associated with the activity of a protein e.g. inflammation,
neuropathology, cardiac anaphylaxis, viral, bacterial, HIV and fungal
infections, autoimmunity, genetic diseases, haematopoietic disorders,
cancemia, platelet disorders, thrombocytopaenia, wounds, burns, ulcers,
chimitis, asthma, diabetes, cancer, multiple sclenosis, depression,
and allergic and disease, parkinson's disease, neurodegenerative and

This sequence is the protein tyrosine phosphatase of the invention, designated PTP-D1. The new PTP proteins are a subfamily of protein tyrosine phosphatases (PTPases) involved with growth factor signal transduction, cell cycle progression, and neoplastic formation. The DNA sequence may be used in the recombinant production of FTP-D1 according to standard DNA methodology. The protein expressed may then be used in the production of antibodies. The muclei caids may also be used in assays to identify modulators of its enzymatic activity and in the production of antibodies. The muclei caids may also be used in assays to detect and quantify expression of FTP-D1 in samples. Methods identifying normal or mutant PTP-D genes, or for measuring amount or activity of the diabetes, or other disorders associated with alterations in cellular phosphotyrosine metabolism
                                                                                                                                                                               Nucleic acids encoding protein phosphotyrosine phosphatase PTP-D1 useful for identification of PTP-D1 modulators.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New composition comprising two or more isolated polypeptides, useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; pain; neuronal tissue; gene therapy;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This is the sequence of the complete human protein tyrosine phosphatase D1 (FTP-D1). The coding sequence was isolated from a human skeletal muscle CDNA library. The phosphatase is used e.g. in a hybridisation assay for detecting a nucleic acid encoding a normal or mutant PTP-D protein or glycoprotein in a cell or subject, using a nucleic acid comprising at least part of a normal or mutant PTP-D protein or glycoprotein as a probe; or a screening assay for a compound capable of binding to a PTP-D protein or glycoprotein, using a PTP-D protein or glycoprotein, using a PTP-D protein or glycoprotein, using a PTP-D protein or glycoprotein, using a PTP-D protein or glycoprotein, using a PTP-D protein or glycoprotein, using a PTP-D protein or glycoprotein, using a PTP-D protein or glycoprotein, using a PTP-D protein or glycoprotein or the compound-binding portion of it attached to a solid support. (Updated on 25-WAR-2003 to correct PR field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             8
                                                                The invention discloses a composition comprising two or more isolated rate or invention discloses a composition comprising two or more isolated rate or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the nucleic acid sequence. Also claimed are a vector comprising the novel polymucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a fit to perform the method, an array, a method for identifying an agent that increases or decreases the expression of the polymucleotide sequence that increases or decreases the expression of the polymucleotide sequence that increases or decreases the expression of a first animal subjected to pain, a method for identifying a compound which regulates the expression of a polymucleotide sequence which is differentially expression of a polymucleotide sequence which is differentially expression of a polymucleotide sequence which is differentially expression of a polymucleotide sequence which is dentifying a compound that regulates the activity of one or more of the polympetides given in the artivity in an animal of one or more of the polympetides given in the activity in an animal of one or more of the polympetides given in the specification, a method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more polympetides or their antibodies. The polymorial or mode comparation on many (CI) and spared nerve injury (Chung), chronic constriction injury (CI) and spared nerve injury (SNI) in an animal e.g. gene the sequence presented is a human protein (shown in Table 2 of the sequence data for this patent did not form part of the printed spared not the sequence data for this patent did not form part of the printed spared not the compounce of the polympetides of the printed in electronic form directly from WIPO at the order of the compounce of the compounce of the compounce of the compounce of the co

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       WO2003016475-A2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          27-FEB-2003.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ADE83529;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             RESULT 22
ADE83529
```

```
The invention discloses a composition comprising two or more isolated rate or human polynucleotides or a polynucleotide which represents a fragment, derivative or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the novel polynucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a tit to perform the method, an array, a method for identifying an agent that is differentially expressed in neuronal tissue of a first animal subjected to pain, a method for identifying a compound which regulates the expression of a polynucleotide sequence which is differentially expressed in an animal subjected to pain, a method for identifying a compound that regulates the activity of one or more of the compound that regulates the activity of one or more of the composition, a method for identifying a compound or small molecule that regulates the extivity in an animal of one or more of the activity in an animal of one or more of the polypeptides given in the activity in an animal of one or more of the polypeptides or their antibodies. The polypuncleotide or more composition composition comprising the one or more polypeptides or their antibodies. The polymucleotide or the compound that compound that it is useful for preparing a medicament for treating pain (e.g. spinal segmental nerve injury (Chung), chronic constriction injury (CI) and spared nerve injury (SNI) in an animal (e.g. spinal sequence presented is a rat protein (shown in Table 2 of the sequence data for this patent did not form part of the printed to specification) which we obtained in electronic form directly from wipp of specification and but was obtained in electronic form directly from wipp of the specification.
New composition comprising two or more isolated polypeptides, useful for preparing a medicament for treating pain in an animal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Rat; pain; neuronal tissue; gene therapy; spinal segmental nerve injury; chronic constriction injury; CCI; spared nerve injury; SNI; Chung.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

the interaction discusses a composition comprising two or more isolated rate of the man polymucleotides or a polymucleotide which represents a fragment, derivative or allelic variation of the mucleic acid sequence. Also claimed are a vector comprising the novel polymucleotide, a host cell comprising the vector, a method for identifying a mucleotide sequence which is differentially regulated in an animal subjected to pain and a xite, the perform the method, an array, a method for identifying an agent that increases or decreases the expression of the polymucleotide sequence that increases or decreases the expression of increasing an agent the expression of a polymucleotide sequence which is differentially expressed in an animal subjected to pain, a method for identifying a compound which regulates the expression of a polymucleotide sequence which is differentially expressed in an animal subjected to pain, a method for identifying a compound that regulates the activity of one or more of the polymucleotides, a method for producing a pharmaceutical composition, a method for identifying a compound or small molecule that regulates the activity in an animal of one or more of the polympetides given in the specification, a method for identifying a compound or small molecule that regulates the activity of one or more of the polympetides or their antibodies. The polympetides or the compound that modulates its activity is useful for preparing a medicament for treating pain and a pharmaceutical composition comprising the one or more polympetides or their antibodies. The polymucleotide or the compound that mother (CCI) and spared nerve injury (SNI)) in an animal (e.g. gene the sequence presented is a rat protein (shown in Table 2 of the sequence data for this patent did not form part of the printed spared nerve injury (SNI)) in an animal pain of the printed spared nerve injury (Enumple or the printed spared nerve injury (Enumple or the printed spared nerve injury (Enumple or more or more or more or more or more or more or mor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

The invention discloses a composition comprising two or more isolated rate or human polymucleotides or a polymucleotide which represents a fragment, derivative or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the nucleic acid sequence. Also claimed are a vector, a method for identifying a nucleotide sequence which is differentially regulated in a animal subjected to pain and a subjected to pain, a method for identifying an agent that increases or decreases the expression of the polymucleotide sequence that increases or decreases the expression of the polymucleotide sequence that increases or decreases the expression of a polymucleotide sequence which is subjected to pain, a method for identifying a compound that regulates the activity of one or more of the compound that regulates the activity of one or more of the compound that regulates the activity of one or more of the compound that compound or amethod for identifying a compound or small molecule that regulates the activity in an animal of one or more of the polypeptides given in the specification, a method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more polypeptides or their antibodies. The polymucleotide or the compound that medulates its activity is useful for preparing a medicament for treating modulates its activity is useful for preparing a medicament for treating the specification, which is adifferentially expressed during pain. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic form directly from WIPO at the polyment of the polyment of the printed and place and the parance of the polyment of the printed and place and this patent did not form part of the printed and place and the printed and place and the place of the place of the place of the place of the place of the place of the place of the place of the place of the place of the place of the place of the place of the place of the 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ô
                                                                                                                                                                                                                                                          New composition comprising two or more isolated polypeptides, useful for preparing a medicament for treating pain in an animal.

```
The sequence is that of a partial fragment of a new protein tyrosine blospstase PTP-S31 that was isolated from RNA from human skeletal muscle. Such DNA can be used to treat cancer and diabetes. See also AAR60875-9 (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                               New protein tyrosine phosphatase PTP-531 - is used to develop prods. for treating or preventing disease associated with abnormal PTP-531, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New substrate trapping mutant protein tyrosine phosphatases (PTP) in which the wild type PTP catalytic domain invariant aspartate is replaced with an unphosphorylated amino acid, useful in gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Protein tyrosine phosphatase; human; mouse; fruit fly; PTP;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        between a protein tyrosine phosphatase (PTP) and a tyrosine phosphorylated polypeptide using fluorescence energy signals. The methods are useful for performing screening assay to identify agents that alter PTP binding to and PTP-mediated catalytic dephosphorylation of phosphotyrosine peptide substrates. The present sequence is that of a catallytic domain of a PTP for comparison with human PTPIB (AAG78262)
                                                                                                                                                                                                                                                                                                                                        PTP; protein tyrosine phosphatase; tyrosine phosphorylated polypeptide; dephosphorylation; phosphotyrosine; human; PTP1B; mouse; fruit fly;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to identifying agents which alter the interaction
the binding of protein tyrosine phosphatases to their substrate. These may be used in disease diagnosis and treatment
                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Screening assays to identify agents that alter protein tyrosine phosphatase (PTP) binding to, and PTP-mediated catalytic dephosphorylation of phosphotyrosine peptide substrates.

The prostate cancer antigens an have neuroprotective, cytostatic, cardioactive, immunomodulatory, muscular, vulnerary, gastrointestinal, mephrotropic, antiinfective, gynaecological and antibacterial activities, and can be used in gene therapy. The prostate cancer antigen polynucleotides may be used for detection of prostate cancer, chromosome factuations of a chromosome markers, and for numerous other diagnostic or research purposes. The prostate cancer antigens may be used to treat disorders such as neural, immune, muscular, reproductive, disorders, wounds, and infectious diseases. AAFI6506 to AAFI6514 to AABIS7301 represent sequences used in the exemplification of the present
                                                                                                                                                                                                                                                                            Prostate cancer associated gene'sequences, referred to as prostate cancer antigens, useful for treatment, prevention, and diagnosis of disorders such as prostate cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human protein tyrosine phosphatase specific antibody protein sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

                                                                                                                                                                                                                                ö
                                                                  This sequence is an antibody of the invention that has sites specifically recognising the intracellular domains of the phosphatase subunits LAR and CD45. The antibody recognises the intracellular domain of two or more protein tyrosine phosphatases (PTPs). The antibody is useful for the detection and assay of PTP including novel phosphatases generated by cloning, and diagnosis, treatment and prevention of insulin resistance related diseases and non-insulin dependent diabetes mellitus, syndrome X and arteriosclerosis and heart disorders
          Antibody for diagnosis and treatment of insulin resistance disorders and syndrome X recognises the intracellular domains of tyrosine kinases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This sequence represents the intracellular domain (P-subunit) of the human leucocyte antigen related (LAR) tyrosine phosphatase (complete sequence in AAY56099). The invention relates to the generation of an antibody recognizing the intracellular domain of the human LAR tyrosine phosphatase. The antibody is used for the diagnosis and treatment of
                                                                                                                                                                                                                                                                                                                                                                                                                                      Intracellular domain; P-subunit; human; leucocyte antigen related; LAR; tyrosine phosphatase; antibody; thyroid cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Antibody recognizing the intracellular domain of the human tyrosine phosphatase LAR.
                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Length 607;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention provides the protein and coding sequences of novel proteins from a variety of organisms, including human, dog, cat, horse, cow, pig, hamster, monkey, macaque, yeast, bacteria, fruit fiy, sea urchin and tomato. These were derived from expressed sequence tags (ESTs from the organism of interest. They can be used in diagnostics, forensics, gene mapping, identification of mutations, to assess biodiversity and for nutritional purposes. The present sequence is a

The invention relates to polynucleotides encoding novel human proteins or their active domains. The polypeptides, polynucleotides and antibodies taised against the polypeptides are used in a method of treatment of a mammal and prevention of disorders caused by the aberrant protein expression or activity. The polypeptides can be used as molecular weight markers, food supplements, and in antibody production. The polypeptides are used to identify compounds which bind to the polypeptides. Polymcleotides of the invention are used as probes and primers, for sequencing, for chromosome or gene mapping, in the production of recombinant proteins, and in generating anti-sense DNA or RNA and in generating anti-sense DNA or RNA and in cherapy. Polypeptides of the invention can be used to target drugs to a tumour, in assays to determine biological activity, to raise the activate of a treating platelet clevels, as tissue markers, and to isolate receptors or ligands. Polypeptides of the invention may also be useful in treating platelet disorders, stem cell disorders, wound healing, treating burns, promoting the proliferation, differentiation and survival of stem cells, as contraceptive, treating osteoporosis and osteocathritis, and and function's platent of funcal infantion or from autoimmnity and seems and plant.
                                                                              Human; novel protein; Antianaemic; osteopathic; antiinflammatory; immunoodulatory; octobatic; neuroprotective; vulnerary; notropic; anticonvulsant; antiarthritic; cerebroprotective; antifungal; antiviral; antibacterial; antiallergic; dermatological; haemostatic; antiasthmatic; thrombolytic; immunogen; antibody; gene therapy; neurological disorder; Parkinson's disease; inflammatory disorder; cancer; asthma; osteoporosis; tissue regeneration; immune disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Isolated polypeptides useful for treating anti-inflammatory diseases, nervous system disorders, and for regenerating bone and cartilage.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Example 4; Page 792-793; 894pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Fang YT, Liu C, Drmanac RT,

This sequence represents murine tyrosine phosphatase MPTP-delta. The cDNA sequence encoding this protein was isolated from murine brain tissue and was cloned, for expression, into the downstream region of a glutathione-S-transferase sequence and expressed as a fusion protein in E. coli. MPTP-delta proteins regulate differentiation and activation of cells. This sequence can be used in the elucidation of the molecular mechanism for information transmission in cells, regulation mechanisms in the nervous system or immune system, or in the mechanism of carcinogenesis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Rat mucocardial cell proliferation associated polypeptide SEQ ID NO 12.
